

METHOD AND APPARATUS FOR IMPLEMENTING A SHARED MESSAGE QUEUE USING A LIST STRUCTURE

ABSTRACT OF THE DISCLOSURE

5 **INS. A3** A method and apparatus for implementing a shared message queue using a list structure. A put
list is defined comprising a sequence of list entries, each of which corresponds to a message in
the queue and has an associated list entry key. Each list entry key corresponding to an
uncommitted message falls within an uncommitted key range defining an uncommitted portion
10 of the put list, while each list entry key corresponding to a committed message falls within a
committed key range defining a committed portion of the put list. To write a message to the
queue, a list entry is added to the put list having a list entry key within the uncommitted key
range. List entry keys in the uncommitted key range are assigned in order of message priority and
in order of arrival time for messages of a given priority. Each list entry key has a more significant
15 portion indicating the list portion to which the corresponding list entry belongs and a less
significant portion indicating the order of the list entry in the list portion. To commit messages to
the queue, the list entry keys associated with the list entries are modified to fall within the
committed key range to move the list entries to the committed portion of the put list while
preserving their relative order as determined by the list entry keys. To read a message from the
20 queue, the list entry whose list entry key has the lowest value in the committed key range is
moved from the committed portion of the put list to a get list defined for the queue. If there are
no messages currently in the committed portion of the put list, the requester waits and is notified
of a subsequent change in state of the committed portion from an empty state to a not-empty
state. To abort a read of the message from the queue, the list entry is moved back from the get list
25 to the committed portion of the put list. To commit a read of the message from the queue, the list
entry is removed from the get list.
